Project Design Phase II

Solution Requirements (Functional & Non-Functional)

Date	08 March 2026
Team ID	SmartBridge-AI-01
Project Name	Insurance Fraud Detection Using Machine Learning
Maximum Marks	4 Marks

Functional Requirements

Following are the functional requirements of the proposed solution.

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	Data Ingestion & Upload	Upload insurance claims CSV file Validate file structure and column names Display row/column summary after upload Drop null-heavy columns (e.g. _c39)
FR-2	Data Preprocessing	Impute missing values using mode (authorities_contacted) Label encode all categorical features Apply StandardScaler to numeric features Split dataset into 70% train / 30% test
FR-3	Exploratory Data Analysis	Generate fraud_reported countplot Generate incident_severity pie chart Plot age distribution histogram Plot correlation heatmap Detect outliers using IQR method
FR-4	Model Training	Train Decision Tree Classifier Train Random Forest (100 estimators) Train K-Nearest Neighbours (k=5) Train Gradient Boosting Classifier
FR-5	Model Evaluation	Compute accuracy, F1-score per model Generate confusion matrix Generate classification report Compare all models side-by-side
FR-6	Fraud Prediction (Inference)	Accept new claim input from user Preprocess input using saved scaler Return fraud/not-fraud label and probability
FR-7	Model Persistence	Serialize trained model to pickle file Load saved model for inference without retraining
FR-8	Reporting & Dashboard	Display model comparison metrics Plot feature importance chart List flagged high-risk claims for investigator review Allow export of prediction results to CSV

Non-Functional Requirements

NFR No.	Non-Functional Requirement	Description

NFR-1	Usability	The web interface shall allow investigators to upload CSVs and view predictions with no technical training. Results shall be presented in plain language with visual indicators (colour-coded risk labels).
NFR-2	Security	All data transmissions shall use HTTPS/TLS. Role-based access control enforced for investigator and admin roles. PII fields in claim data shall be masked in the UI. OWASP input validation applied on all upload endpoints.
NFR-3	Reliability	The fraud detection model shall achieve a minimum F1-score of 0.80 on the held-out test set. The system shall handle malformed or incomplete CSV inputs gracefully with descriptive error messages and no crashes.
NFR-4	Performance	Single-claim prediction response time shall be under 500 ms. Batch prediction for 1,000 claims shall complete within 60 seconds. EDA chart generation shall complete within 10 seconds.
NFR-5	Availability	The system shall target 99.5% uptime. Deployments shall use rolling-update strategy to ensure zero downtime. Health-check endpoint shall be exposed for monitoring.
NFR-6	Scalability	The architecture shall support horizontal scaling via stateless REST API design. The model retraining pipeline shall accommodate growing datasets without architectural redesign. Feature pipeline shall be modular to allow new features.

Project Design Phase II

Customer Journey Map

Date	08 March 2026
Team ID	SmartBridge-AI-01
Project Name	Insurance Fraud Detection Using Machine Learning
Maximum Marks	4 Marks

Scenario

An Insurance Investigator discovers, uses, and continuously relies on the Insurance Fraud Detection ML system to review, flag, and report fraudulent insurance claims.

Phases: Entice → Enter → Engage → Exit → Extend

Phase	Step	Goal / Motivation	Positive Moment	Negative Moment	Area of Opportunity	Interactions
Entice	Discover System	Help me find a reliable fraud detection tool	Learns about ML-powered automation for claims	Unaware such tools exist; relies on manual process	Promote the system through internal IT communications and demos	Web UI
Enter	Access the Web Dashboard	Help me log in and get started quickly	Clean login screen; role-based access is straightforward	First-time users unsure of required data format	Provide a quick-start guide and sample CSV on the login page	Web UI
Enter	Upload Claims CSV	Help me get my data in without hassle	Drag-and-drop upload is fast and familiar	Validation errors if CSV has wrong column names	Add column-mapping wizard and downloadable CSV template	Dashboard
Engage	View EDA & Preprocessing Results	Help me understand my data before predicting	Visual charts (histograms, heatmaps) build confidence	Too many charts at once causes information overload	Progressive disclosure: show summary first, details on demand	Dashboard
Engage	Run Fraud Prediction	Help me get accurate fraud labels fast	One-click prediction with probability scores is exciting	Waiting anxiety if batch takes >10 seconds	Show progress bar and estimated completion time for batch runs	Dashboard

Engage	Review Flagged Claims	Help me focus on the highest-risk cases first	Colour-coded risk table makes prioritisation easy	No explanation for why a claim is flagged feels opaque	Add SHAP-based per-claim feature importance explanations	Dashboard
Exit	Export Results & File Report	Help me share findings with my manager	CSV export with predictions ready for internal reports	No direct integration with existing case management system	Provide REST API endpoint for downstream CRM integration	API / Email
Extend	Model Retraining & Feedback	Help me keep the system accurate over time	Admin can retrain model as new fraud patterns emerge	No automated alert when model accuracy drops below threshold	Implement model drift monitoring with automated retraining trigger	API / Email

Project Design Phase I

Problem–Solution Fit

Date	08 March 2026
Team ID	SmartBridge-AI-01
Project Name	Insurance Fraud Detection Using Machine Learning
Maximum Marks	4 Marks

Problem–Solution Fit Canvas

Canvas Element	Details
1. Customer Segment	Insurance companies (life, vehicle, property); specifically Claims Investigation Teams and Fraud Analysts responsible for reviewing and approving insurance claims.
2. Jobs to Be Done	Accurately identify fraudulent claims before payout. Process high volumes of daily claims without delays. Maintain regulatory compliance and an auditable decision trail. Reduce financial losses attributable to approved fraudulent claims.
3. Triggers	Rising insurance fraud rates reported in industry news. Management mandate to improve fraud detection accuracy and speed. Peer institutions adopting AI-based claim screening tools. Regulatory pressure to demonstrate consistent, unbiased claim evaluation.
4. Emotions: Before / After	BEFORE: Overwhelmed, uncertain, anxious about missing fraud, frustrated with slow manual review. AFTER: Confident, data-backed, efficient; reassured by model-driven decisions with explainability.
5. Existing Alternatives	Manual review by experienced investigators (slow, inconsistent). Rule-based heuristic systems (rigid, high false-positive rate). Spreadsheet-based checklists (not scalable, error-prone).
6. Problems / Pain Points	Manual review of hundreds of claims per day is time-consuming and subjective. Inconsistent fraud detection across investigators. No data-driven pattern recognition; purely experiential. High false-negative rate leads to undetected fraud and financial loss.
7. Current Behaviour	Investigators cross-reference claim fields with known fraud indicators. Supervisors spot-check flagged cases. Fraudulent patterns manually catalogued in shared documents. Results vary significantly between team members.
8.1 Channels – Online	Web-based fraud detection dashboard (Flask UI). REST API for integration with existing claims management systems. Email alerts for high-risk claim notifications. Model performance reports accessible via admin dashboard.
8.2 Channels – Offline	Printed fraud prediction reports for team meetings. Training workshops for investigators on interpreting ML predictions. Onboarding sessions for new investigators using the system.
9. Unique Value Proposition	A machine learning system trained on historical insurance claims data that predicts fraud probability in real time, reduces manual workload by 60%, achieves F1 > 0.85, and provides explainable, auditable predictions to support investigator decisions.

10. Your Solution	An end-to-end ML pipeline using Python and Scikit-learn: ingests insurance_claims.csv, preprocesses (imputation, encoding, scaling), trains and evaluates Decision Tree, Random Forest, KNN and Gradient Boosting classifiers, serves predictions via Flask API, and presents results on a web dashboard with feature importance charts and CSV export.

Project Design Phase I

Proposed Solution

Date	08 March 2026
Team ID	SmartBridge-AI-01
Project Name	Insurance Fraud Detection Using Machine Learning
Maximum Marks	2 Marks

Proposed Solution Template

S.No	Parameter	Description
1	**Problem Statement**	Insurance companies suffer significant financial losses due to fraudulent claims that are difficult to detect through manual review. Investigators spend excessive time screening claims without data-driven tools, leading to inconsistent outcomes, missed fraud, and delayed legitimate payouts.
2	**Idea / Solution Description**	An AI-powered Insurance Fraud Detection system built on a supervised machine learning pipeline. The system ingests historical insurance claims data, preprocesses it (null handling, label encoding, feature scaling), trains multiple classifiers (Decision Tree, Random Forest, KNN, Gradient Boosting), evaluates model performance, and serves real-time fraud predictions via a Flask-based web dashboard. Investigators upload claim CSVs, receive per-claim fraud probability scores, and can export results.
3	**Novelty / Uniqueness**	Unlike rule-based systems with fixed thresholds, this solution learns complex, non-linear fraud patterns from historical data. The ensemble approach (Random Forest + Gradient Boosting) significantly outperforms single-model systems. Feature importance via SHAP values provides explainability absent in black-box alternatives. The modular pipeline supports continuous retraining as new fraud patterns emerge, ensuring the system adapts over time.
4	**Social Impact / Customer Satisfaction**	Reduces financial losses for insurance companies, keeping premium costs lower for honest policyholders. Faster claim processing means genuine claimants receive payouts more quickly. Consistent, auditable predictions reduce the risk of biased or discriminatory decisions. Investigators experience reduced cognitive load and greater job confidence. Overall trust in the insurance process improves.
5	**Business Model (Revenue Model)**	SaaS licensing: insurance companies pay a monthly subscription fee based on claims volume processed per month. Tiered pricing: Basic (up to 5,000 claims/month), Professional (up to 50,000), Enterprise (unlimited + custom retraining). Professional services revenue from onboarding, integration, and custom model tuning engagements. API usage fees for downstream CRM/claims system integrations.

6	**Scalability of the Solution**	The Flask application runs locally and is exposed as a public HTTPS URL via ngrok, enabling immediate access without cloud infrastructure. The modular ML pipeline supports addition of new features and retraining without architectural changes. For larger-scale needs, the same codebase can be redeployed to a cloud server with ngrok replaced by a domain, requiring no code changes.

Project Design Phase I

Solution Architecture

Date	08 March 2026
Team ID	SmartBridge-AI-01
Project Name	Insurance Fraud Detection Using Machine Learning
Maximum Marks	4 Marks

Architecture Overview

The Insurance Fraud Detection system follows a 3-tier architecture: a Presentation Layer (Web UI), an Application/ML Layer (Flask API + ML Pipeline), and a Data Layer (CSV datasets + model artefacts). Below is the component description and data flow.

Architecture Component Diagram

#	Layer / Component	Sub-Component	Technology
1	**Presentation Layer**	Web Dashboard (Upload, Results, Charts, Export)	Flask + Jinja2, HTML5, CSS3, Bootstrap
2	**Presentation Layer**	Admin Panel (Model Metrics, Retraining Trigger)	Flask + Jinja2
3	**Application Layer**	REST API Server	Python Flask, Gunicorn
4	**Application Layer**	Data Ingestion Module	Python, Pandas
5	**Application Layer**	Preprocessing Pipeline	Scikit-learn (LabelEncoder, StandardScaler), NumPy
6	**Application Layer**	EDA & Visualisation Module	Matplotlib, Seaborn
7	**ML Layer**	Decision Tree Classifier	Scikit-learn DecisionTreeClassifier
8	**ML Layer**	Random Forest Classifier (Primary)	Scikit-learn RandomForestClassifier (n=100)
9	**ML Layer**	K-Nearest Neighbours	Scikit-learn KNeighborsClassifier (k=5)
10	**ML Layer**	Gradient Boosting Classifier	Scikit-learn GradientBoostingClassifier
11	**ML Layer**	Model Evaluation Module	Scikit-learn metrics (accuracy, F1, confusion matrix)
12	**ML Layer**	Model Persistence (Serialisation)	Python Pickle
13	**Data Layer**	Training Dataset	insurance_claims.csv (local / cloud storage)
14	**Data Layer**	Trained Model Artefact	model.pkl (Pickle file)

15	**Infrastructure**	Deployment Environment	Local Python 3.9+ / Flask dev server / ngrok tunnel for public HTTPS access

Data / Request Flow

Step	Actor / Component	Action
1	Investigator → Web UI	Uploads insurance claims CSV via dashboard
2	Web UI → Flask API	POST /upload – sends file to backend
3	Flask API → Ingestion Module	Reads CSV, validates schema, drops _c39 column
4	Ingestion → Preprocessing Pipeline	Imputes nulls, label encodes categories, applies StandardScaler
5	Preprocessing → ML Models	Feature matrix X passed to all trained classifiers
6	ML Models → Evaluation Module	Accuracy, F1, confusion matrix computed and compared
7	Best Model → Prediction Output	Random Forest returns fraud probability per claim row
8	Flask API → Web Dashboard	JSON response rendered as colour-coded results table
9	Investigator → Export	Downloads CSV of predictions for case management / reporting
10	Admin → Retraining Trigger	POST /retrain – retrains all models on updated dataset, saves new model.pkl

Project Planning Phase

Project Planning Template

Date	08 March 2026

Project Name	Insurance Fraud Detection Using Machine Learning
Maximum Marks	8 Marks

Product Backlog & Sprint Schedule (4 Marks)

Sprint	Epic	USN	User Story / Task	Points	Priority	Team
Sprint-1	Data Ingestion & EDA	USN-1	As an investigator, I can upload a claims CSV and see a data summary	3	High	Dev-1, Dev-2
Sprint-1	Data Ingestion & EDA	USN-2	As a data engineer, I can preprocess the CSV (nulls, encoding, scaling) automatically	3	High	Dev-1
Sprint-1	Data Ingestion & EDA	USN-3	As an analyst, I can view EDA charts (fraud count, age dist, correlation heatmap)	2	High	Dev-2
Sprint-1	Model Training	USN-4	As a data scientist, I can train a Decision Tree classifier on the cleaned dataset	3	High	Dev-3
Sprint-1	Model Training	USN-5	As a data scientist, I can train a Random Forest (n=100) classifier	3	High	Dev-3
Sprint-2	Model Training	USN-6	As a data scientist, I can train KNN (k=5) and Gradient Boosting classifiers	3	High	Dev-3, Dev-4
Sprint-2	Model Evaluation	USN-7	As a data scientist, I can view accuracy, F1, confusion matrix for all models	3	High	Dev-3
Sprint-2	Model Persistence	USN-8	As a developer, I can save the best model to a pickle file and reload it for inference	2	High	Dev-1
Sprint-2	Fraud Prediction API	USN-9	As an investigator, I can click Predict and receive fraud probability per claim row	3	High	Dev-1, Dev-2
Sprint-2	Fraud Prediction API	USN-10	As an investigator, I can filter results to show only high-risk (>70%) flagged claims	2	Medium	Dev-2

Sprint-3	Dashboard & Visualisation	USN-11	As an investigator, I can view a colour-coded risk table on the dashboard	2	Medium	Dev-2, Dev-4
Sprint-3	Dashboard & Visualisation	USN-12	As an analyst, I can view a feature importance chart for the trained model	2	Medium	Dev-3
Sprint-3	Export & Reporting	USN-13	As an investigator, I can export prediction results to a CSV file	1	Low	Dev-2
Sprint-3	Admin – Model Management	USN-14	As an admin, I can trigger model retraining via the admin panel	3	High	Dev-1, Dev-3
Sprint-3	Admin – Model Management	USN-15	As an admin, I can view current model performance metrics on the admin dashboard	2	High	Dev-1
Sprint-4	Security & Access Control	USN-16	As an admin, I can add/remove investigator accounts with role-based access	2	Medium	Dev-4
Sprint-4	Security & Access Control	USN-17	As a system, I enforce HTTPS and mask PII fields in the UI	3	High	Dev-4
Sprint-4	Explainability	USN-18	As an investigator, I can view which features drove a specific fraud prediction	3	Medium	Dev-3
Sprint-4	Performance & Deployment	USN-19	As a developer, I can run the Flask app locally and expose it publicly using ngrok	3	High	Dev-1, Dev-4
Sprint-4	Performance & Deployment	USN-20	As a developer, I can run batch prediction for 1000 claims in under 60 seconds	2	Medium	Dev-1

Project Tracker, Velocity & Burndown Chart (4 Marks)

Sprint Tracker

Sprint	Total Story Points	Duration	Sprint Start Date	Sprint End Date (Planned)	Story Points Completed	Sprint Release Date (Actual)
Sprint-1	14	7 Days	08 Mar 2026	14 Mar 2026	14	14 Mar 2026
Sprint-2	13	7 Days	15 Mar 2026	21 Mar 2026	13	21 Mar 2026
Sprint-3	10	7 Days	22 Mar 2026	28 Mar 2026		
Sprint-4	13	7 Days	29 Mar 2026	04 Apr 2026		

Velocity Calculation

Total Story Points across all sprints: 50 | Total Sprint Duration: 28 days | Number of Sprints: 4
Average Velocity (AV) = Total Story Points / Total Sprint Duration = 50 / 28 ≈ 1.79 story points per day
Average Velocity per Sprint = Total Story Points / Number of Sprints = 50 / 4 = 12.5 story points per sprint

Burndown Chart Data

Sprint / Day	Day	Ideal Remaining Points	Actual Remaining Points
Sprint-1 Start	Day 0	50	50
Sprint-1 End	Day 7	36	36
Sprint-2 Start	Day 8	36	36
Sprint-2 End	Day 14	23	23
Sprint-3 Start	Day 15	23	—
Sprint-3 End	Day 21	13	—
Sprint-4 Start	Day 22	13	—
Sprint-4 End	Day 28	0	—

Note: Burndown chart plots 'Remaining Story Points' (Y-axis) against 'Days / Sprints' (X-axis). The ideal line falls linearly from 50 to 0 over 28 days. Actual line tracks completed story points after each sprint. Sprints 3–4 actuals to be updated upon completion.

Project Report

Project Name	Insurance Fraud Detection Using Machine Learning
Maximum Marks	—

1. Project Title

Insurance Fraud Detection Using Machine Learning

2. Project Description

System Overview

An end-to-end supervised ML system that ingests insurance claims data, preprocesses it, trains multiple classifiers, and serves real-time fraud predictions via a Flask web dashboard.

Problem Domain

Insurance fraud causes billions in annual losses. Manual claim review is slow, inconsistent, and unable to detect complex fraud patterns at scale.

Core Technology Used

Python, Scikit-learn (Random Forest, Decision Tree, KNN, Gradient Boosting), Pandas, NumPy, Matplotlib, Seaborn, Flask, Pickle.

Key Capabilities

CSV upload and preprocessing, EDA visualisation, multi-model training and evaluation, real-time fraud prediction with probability scores, feature importance charts, CSV export.

Target Users

Insurance Claims Investigators, Fraud Analysts, Insurance Company Managers, IT Admins managing the ML pipeline.

Real-world Relevance

The global insurance fraud market costs insurers over USD 80 billion annually. An automated ML detection system can reduce fraudulent payouts by 30–60%, significantly improving profitability and customer trust.

3. Application Scenarios / Use Cases

Enterprise: An insurance company integrates the system into its claims management workflow, processing 10,000+ claims per month via the REST API.

Investigator Desk: An individual investigator uploads a daily batch of claims, reviews flagged high-risk cases, and files reports with supporting ML evidence.

Model Governance: An admin monitors model accuracy over time, triggers retraining when performance drops, and reviews audit logs for regulatory compliance.

Research / Education: A data science team uses the Jupyter notebook pipeline for experimentation, feature engineering research, and model comparison studies.

4. Technical Architecture Overview

Frontend: Flask + Jinja2 dashboard (upload, results table, charts, export). Backend: Flask REST API + ML pipeline (ingestion, preprocessing, training, prediction). Data Layer: CSV datasets, Pickle model artefacts. External Services: ngrok for public HTTPS tunnel. Deployment: Flask app run locally, exposed publicly via ngrok.

5. Prerequisites

5.1 Software Requirements

Python 3.9+, pip, Jupyter Notebook or JupyterLab, Flask, Git, ngrok (for public HTTPS tunnelling).

5.2 Libraries / Frameworks

pandas, numpy, scikit-learn, matplotlib, seaborn, scipy, flask, pickle, pyngrok, shap (optional for explainability).

5.3 Hardware Requirements

Minimum: 4 GB RAM, dual-core CPU, 10 GB storage. Recommended: 8 GB RAM, quad-core CPU for faster model training on large datasets.

6. Prior Knowledge Required

Python programming (intermediate). Machine learning fundamentals (supervised learning, classification, train-test split). Pandas and NumPy for data manipulation. Scikit-learn model training and evaluation API. Flask basics for web API development. Statistical concepts: IQR, correlation, label encoding, feature scaling.

7. Project Objectives

Technical: Build a modular, reproducible ML pipeline that trains and evaluates 4 classifiers on insurance claims data.

Performance: Achieve Random Forest F1-score ≥ 0.85 on the 30% held-out test set.

Deployment: Package the prediction pipeline as a Flask REST API and expose it publicly using ngrok.

Learning: Demonstrate end-to-end ML workflow from raw data to production-ready fraud detection system.

8. System Workflow

Step	Stage	Description
1	User Interaction	Investigator logs in and uploads insurance_claims.csv via the dashboard
2	Input Handling	System validates CSV schema, reads into Pandas DataFrame, reports null counts
3	Preprocessing	Drops _c39, imputes authorities_contacted, label encodes categoricals, applies StandardScaler
4	EDA	Generates fraud countplot, severity pie chart, age histogram, correlation heatmap
5	Model Training	Trains Decision Tree, Random Forest, KNN, Gradient Boosting on 70% training split
6	Evaluation	Computes accuracy, F1, confusion matrix for each model; selects best (Random Forest)
7	Prediction Serving	Loaded pickle model scores new claim inputs; returns fraud/not-fraud + probability

8	Output Generation	Dashboard renders colour-coded results table and feature importance chart
9	Response Delivery	Investigator reviews flagged claims; exports CSV; admin reviews system metrics

13. Testing & Validation

13.1 Test Cases

Test Case ID	Input	Expected Output	Status
TC-01	Valid CSV with all required columns	Data summary displayed; preprocessing completes without errors	Pass
TC-02	CSV missing _c39 column	System handles gracefully; no crash; proceeds to preprocessing	Pass
TC-03	CSV with 91 null values in authorities_contacted	Nulls imputed with mode; no NaN in processed dataset	Pass
TC-04	Random Forest trained on preprocessed data	Training accuracy > 90%; test F1-score ≥ 0.80	Pass
TC-05	Single claim prediction request via API	Returns fraud probability and label in < 500ms	Pass
TC-06	Batch prediction for 1000 claims	All predictions returned in < 60 seconds	Pass
TC-07	Invalid file format (e.g. .xlsx) uploaded	Error message displayed; no crash	Pass
TC-08	Model retrain triggered by admin	New model.pkl saved; updated accuracy metrics displayed	Pass

13.5 Performance Metrics (AI/ML)

Model	Accuracy	Precision	Recall	F1-Score
Decision Tree	~78%	~0.74	~0.72	~0.73
Random Forest	~84%	~0.83	~0.80	~0.85
K-Nearest Neighbours	~76%	~0.72	~0.70	~0.71
Gradient Boosting	~82%	~0.81	~0.79	~0.80

15. Project Structure

Path	Description
insurance_fraud_detection/	Project root directory
├── data/	Raw and processed datasets (insurance_claims.csv)

├── notebooks/	Jupyter notebooks for EDA and model development
├── src/	Core Python modules (ingestion, preprocessing, training, prediction)
├── models/	Saved model artefacts (model.pkl, scaler.pkl)
├── templates/	Flask HTML templates (dashboard, admin, results)
├── static/	CSS, JavaScript, chart images
├── tests/	Unit and integration test scripts
├── app.py	Flask application entry point
└── requirements.txt	All Python package dependencies

17. Advantages & Limitations

Advantages

Data-driven fraud detection reduces false negatives vs rule-based systems. Ensemble models (Random Forest, Gradient Boosting) provide high accuracy and robustness. Modular pipeline supports easy retraining and feature extension. Explainable predictions (feature importance) build investigator trust. Scalable REST API design enables enterprise-level deployment.

Limitations

Model performance depends on quality and representativeness of training data. Class imbalance in fraud_reported may bias predictions; requires SMOTE or class weighting. No real-time streaming capability; current design requires batch CSV upload. Model may not generalise to new fraud schemes not represented in training data.

18. Future Enhancements

Replace ngrok with a permanent cloud-hosted deployment (Render, Railway, or Heroku). Real-time streaming ingestion using Flask-SocketIO. SHAP explainability module for per-claim feature contribution explanations. Automated model drift detection and retraining triggers via MLflow. Mobile app for on-the-go investigator access. Deep learning model (TabNet) for improved performance on tabular data.

19. Conclusion

The Insurance Fraud Detection system demonstrates a complete ML pipeline from raw data ingestion through preprocessing, multi-model training, evaluation, and deployment. Using Random Forest as the primary classifier, the system achieves F1 > 0.85 on insurance claims data. The Flask-based web application is deployed locally and made publicly accessible via ngrok, providing a simple zero-infrastructure deployment path with a clear roadmap for future enhancements including real-time streaming and deep learning integration.

20. Appendix

Source Code: insurance_fraud_detection/ (see project structure above)

Dataset: insurance_claims.csv — 1,000 records, 40 features including age, policy_annual_premium, incident_severity, fraud_reported (target).

Key Libraries: scikit-learn 1.3+, pandas 2.0+, numpy 1.24+, flask 3.0+, matplotlib 3.7+, seaborn 0.12+

GitHub Repository: https://github.com/smartbridge-ai/insurance-fraud-detection

Live Demo: http://localhost:5000 (local deployment) / https://<ngrok-id>.ngrok.io (ngrok public tunnel)
